King Farm Citizens Assembly Turf Plan

- Round 1
 - Occurs late march/April timeframe, an application of 10-0-2 corn gluten granular pre-emergent will be applied to help prevent crabgrass from germinating later in the summer. At this time, broadleaf weeds will also be spot sprayed with Branch Creek Weed Shield (Clove Oil)
- Round 2
 - Round 2 Occurs around late spring/early summer, usually in late May or June. This application is a follow up to spot treat any broadleaf weeds that may have been missed or have germinated since the property was last treated. CLS will also do a 2nd application of 10-0-2 Corn gluten for improved crabgrass control. We will be using Branch Creek Weed Shield for this application as well.
- Round 3
 - Round 3 occurs late summer/early fall, generally August/September timeframe. This treatment includes the application of EarthWorks 8-2-2 Turf fertilizer. Should soil test results show no need for phosphorus, the 8-2-2 will be replaced with EarthWorks 16-0-5. At this time, any remaining broadleaf weeds will again be spot treated with branch creek weed shield as needed in order to maintain a healthy stand of turf.
- Round 4
 - Round 4 is a late fall fertilizer application, typically occurring around the month of October, concurrent with aeration and seeding services. This is a follow up application of Earth works 16-0-5, or should additional phosphorus applications be necessary, Earthworks 8-2-2 will be applied. No spot treatment of broadleaf weeds will occur at this time.
